Frequently Asked Questions (FAQ)

Q1: When should I call the veterinarian during foaling?

A1: Call your veterinarian immediately if the mare is in labor for more than two hours without progressing, if the foal is not delivered within 30 minutes of the water breaking, if there are signs of fetal distress (e.g., abnormal heart rate, prolonged straining), or if the foal is born with complications such as breathing difficulties or an umbilical cord prolapse. McFarland's book provides a detailed list of emergency situations requiring immediate veterinary intervention.

Q2: How often should I weigh my foal?

A2: Weighing your foal regularly, ideally weekly, helps monitor growth and identify potential nutritional deficiencies early on. McFarland's guide provides guidelines on appropriate weight gain curves for foals of different breeds and ages, allowing you to identify potential problems.

Q3: What are the signs of colic in a foal?

A3: Colic in foals can manifest in several ways including pawing, kicking at the belly, lying down and getting up repeatedly, restlessness, and lack of appetite. Severe cases may also show signs of sweating and rolling. If you suspect your foal has colic, immediate veterinary attention is essential, as described in McFarland's work.

Q4: How important is colostrum?

A4: Colostrum is crucial; it's the first milk produced by the mare and contains vital antibodies that protect the foal against infections during its early, vulnerable days. Ensuring the foal nurses immediately and receives adequate colostrum is critical for its immune system development, as highlighted in McFarland's guide.

Q5: What are the signs of a healthy newborn foal?

A5: A healthy newborn foal will stand and nurse within a few hours, have a bright alert demeanor, clear eyes, and normal bowel and bladder functions. The "Foaling Primer" offers a detailed checklist for assessing the health of the newborn foal.

Q6: What vaccinations should my foal receive?

A6: Consult your veterinarian to determine the appropriate vaccination schedule for your foal, which will likely include vaccines against common equine diseases such as tetanus, influenza, rhinopneumonitis, and West Nile virus. McFarland's guide emphasizes the importance of preventive health care and veterinary guidance on vaccination schedules.

Q7: When should I wean my foal?

A7: Weaning should be a gradual process typically beginning around four to six months of age, depending on the foal's development and the mare's milk supply. McFarland offers advice on managing weaning transitions to minimize stress and digestive upset.

Q8: How can I prevent parasites in my foal?

A8: Regular parasite control through fecal egg counts and appropriate deworming strategies is essential. McFarland stresses the importance of consulting your veterinarian to determine the best parasite control program for your foal and its environment.
