Understanding Fluidized Bed Combustion (FBC) in Thermax Boilers

The core technology behind the Thermax AFBC boiler is **fluidized bed combustion (FBC)**. This process involves suspending fuel particles on a bed of inert material (typically sand or limestone) using an upward flow of air. This fluidized bed allows for efficient combustion at relatively low temperatures, resulting in several key advantages. The even distribution of heat promotes efficient heat transfer to the boiler tubes, while the inherent mixing within the bed ensures complete combustion. This low-temperature combustion significantly reduces NOx emissions, a crucial factor for environmental compliance. The use of limestone also facilitates sulfur capture, reducing SOx emissions.
